Many introduced species can have an adverse effect on native biodiversity, especially on a delicate island habitat such as Trinidad and Tobago. Three forest species are being particularly troubling, namely *Tectona grandis* (teak), *Acacia mangium* (brown salwood) and *Leucaena leucocephala* (white leadtree). Islands are especially at risk because of their delicate ecosystems and endemic natural species.

Over the past decades many plant species have been introduced for a variety of

[Urochloa ma ch grass *(Rottboellia cochinchinensis)*, paragrass *(Brachiaria mutica)*, and others, that are likely to pose the most significant threat to biodiversity, crop and pasture production.
