CABI Project Manager

Introduced purposely, this weed has naturalised and spread rapidly. It has caused significant damage to native vegetation and negatively impacted wildlife. While control measures have been implemented, the high density of the weed is encouraging invasive rodents. This project will take a strategic and integrated approach to control Mexican thorn on Ascension Island. The project will focus on the control of Mexican thorn in the most damaged areas, including the control of invasive rodents. The project will also focus on the control of Mexican thorn in the most damaged areas, including the control of invasive rodents. The project will also focus on the control of Mexican thorn in the most damaged areas, including the control of invasive rodents.

from South Africa. The project is funded by the Department of Agriculture, Food and Forestry, and the Department of Environment and Heritage.
